

How long does it take for an oil management system to start paying for itself?

There is no simple one-size-fits-all solution. There are many factors that need to be considered:

- How big is the workshop? How many lifting platforms/pits are there in the workshop?
- How many different types of media will be used?
- How is the oil currently being delivered?
- What is to be changed?
- What is the desired degree of integration with electronic data processing systems?
- How high is the current ratio of oil shrinkage?

An oil management system is an upfront investment, but within a short amount of time, you will see its benefits:

- Oils and other media are cheaper in bulk than in individual drums.
- There will no longer be a need to handle/dispose of oil drums.
- Savings will be made on unnecessary work and travels.

- No dispensing takes place without being logged and billed. Oil shrinkage becomes practically eliminated.
- An oil management system is environmentally-friendly.

The time saved allows more service procedures to be performed per day and effectively increases performance in the long term. The increasing cost of mineral oil and a high consumption volume of fluids also pays towards the initial capital investment.

And of course HORN TECALEMIT will provide you with comprehensive support to help you increase the efficiency and cost-effectiveness of all fluids.

Once all of these factors have been considered, it is clear that a professional oil management system by HORN TECALEMIT is a wise investment.

Please call our friendly expert team for further information and advice.

GO WITH THE FLOW.

The Professional's Choice for Workshops

HORN TECALEMIT is well-known for its expertise in providing customers with innovative workshop solutions, having produced oil management systems for nearly 40 years.

The company regularly works with top vehicle manufacturers, customising workshop devices that contribute significantly to professional vehicle maintenance.

The first class systems are proven to increase profitability, through improvements in:

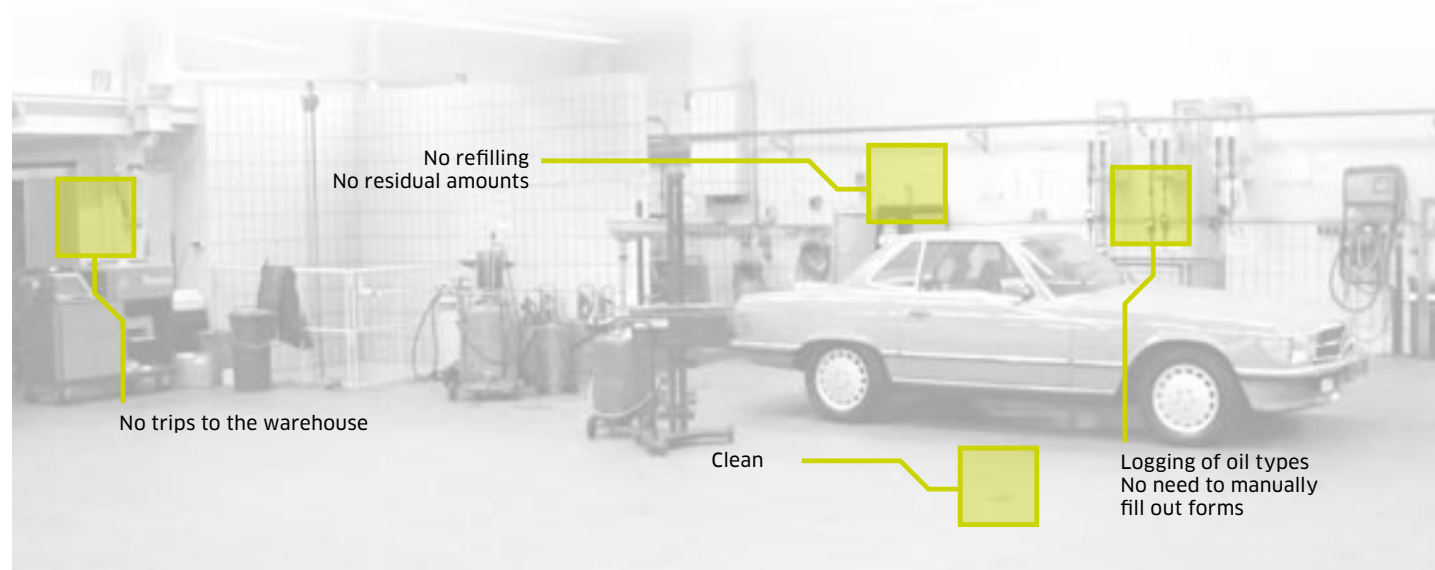

- Safety
- Ergonomics and user-friendliness
- Traceability
- Productivity

Bespoke systems are carefully thought out in order to produce the best results, achieved through the creation of a structured workplace with efficient workflows.

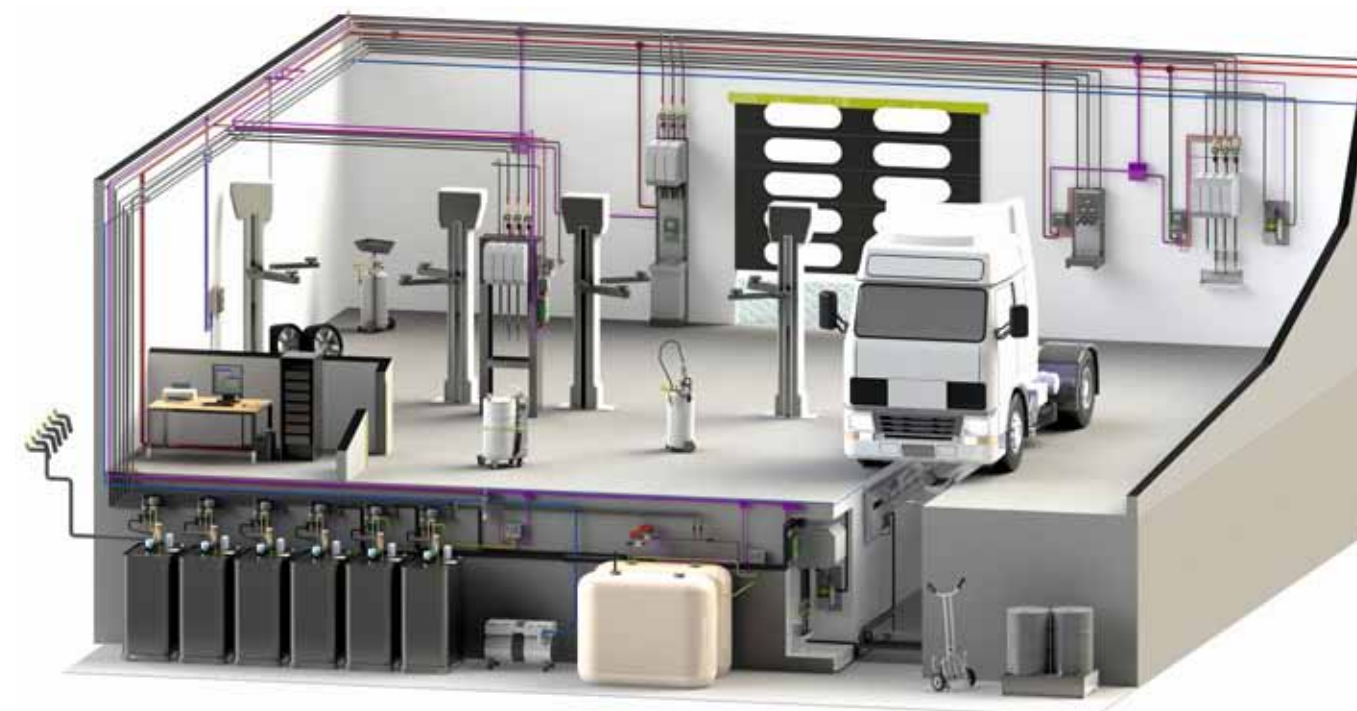

The HORN TECALEMIT oil management system automatically tracks and monitors the amounts of all liquids dispensed in your workshop in real-time. All dispensing amounts are logged and can be matched directly to workshop orders and invoices via an existing network. This means that supply shortages due to insufficient inventory can be avoided.

What this means for your workshop:

- A structured workplace motivates employees and gives customers confidence in your professionalism and services.
- Automated processes save time – with more servicing procedures completed per day, the number of billable working hours is increased.
- Precise and logged dispensing prevents oil shrinkage. For you, this means that no dispensing takes place without being billed, to maximize profits.

Tailor-made for you

The modular system can be used both for individual service points as well as large utility vehicle workshops, and consists of components that have been designed to work together seamlessly. These include:

- Storage tanks for fresh oil, used oil and radiator coolant, fill level measurements, overfill protection, and leak indicator.
- Electric and pneumatic pumps for efficient delivery.
- Nozzle columns with retracting reels, wall dispensing devices.
- TKS IV/TMS III central electronic control unit for expert logging.
- Independent software, or with connection to common dealer management systems (DMS) for accurate monitoring.

At the heart of the supply installation are the TKS IV or TMS III central units, which can easily be connected to an existing dealer management system or data processing system, thereby combining both processes to simplify the system further.

Many DMSs already allow the pre-setting of required amounts according to manufacturer specifications.

With its intuitive menu layout and large display, the system is extremely easy to use. In order to carry out a dispensing, the employee simply enters the order number, his personal code (pin code/Rfid transponder), oil type (dispensation point) and the amount of oil. The system ensures supplies will be exactly where you need them to be, thereby eliminating shrinkage.

HORN TECALEMIT provides oil management systems you can rely on.
